

Brief:

Here, we want to implement Flight search functionality. You have a form, where user can input and search for the flights. Then user will be able to see the search results.

Problem statement:

- Create a flight JSON data object for your all flights available to make the search happen.
- Take the User input from the search form and perform a search on the flight JSON data and display the valid search results in the results section.
- Feel free to use any JS frameworks (like Angular or React JS) or Core JS to build this application.

What are we looking for:

- Code structure and organization.
- Simplicity and ease of understanding the code.
- Understanding of **JavaScript, Unit Test, HTML, JSON and CSS**.
- Use any preprocessor for writing styles (SCSS / LESS)

Brownie Points:

- Make the page Responsive i.e. device friendly (iPad, iPhone, Android) and compatible with all modern browsers.
- Creativity in terms of look and feel of the page. (Do not use CSS frameworks like Bootstrap, Foundation etc)
